Functional Neuroimaging Techniques

Extracting transient neuronal activity

- ➔ • Initial transient mapping
 - BOLD latency and width modulation/mapping
 - Direct neuronal current imaging

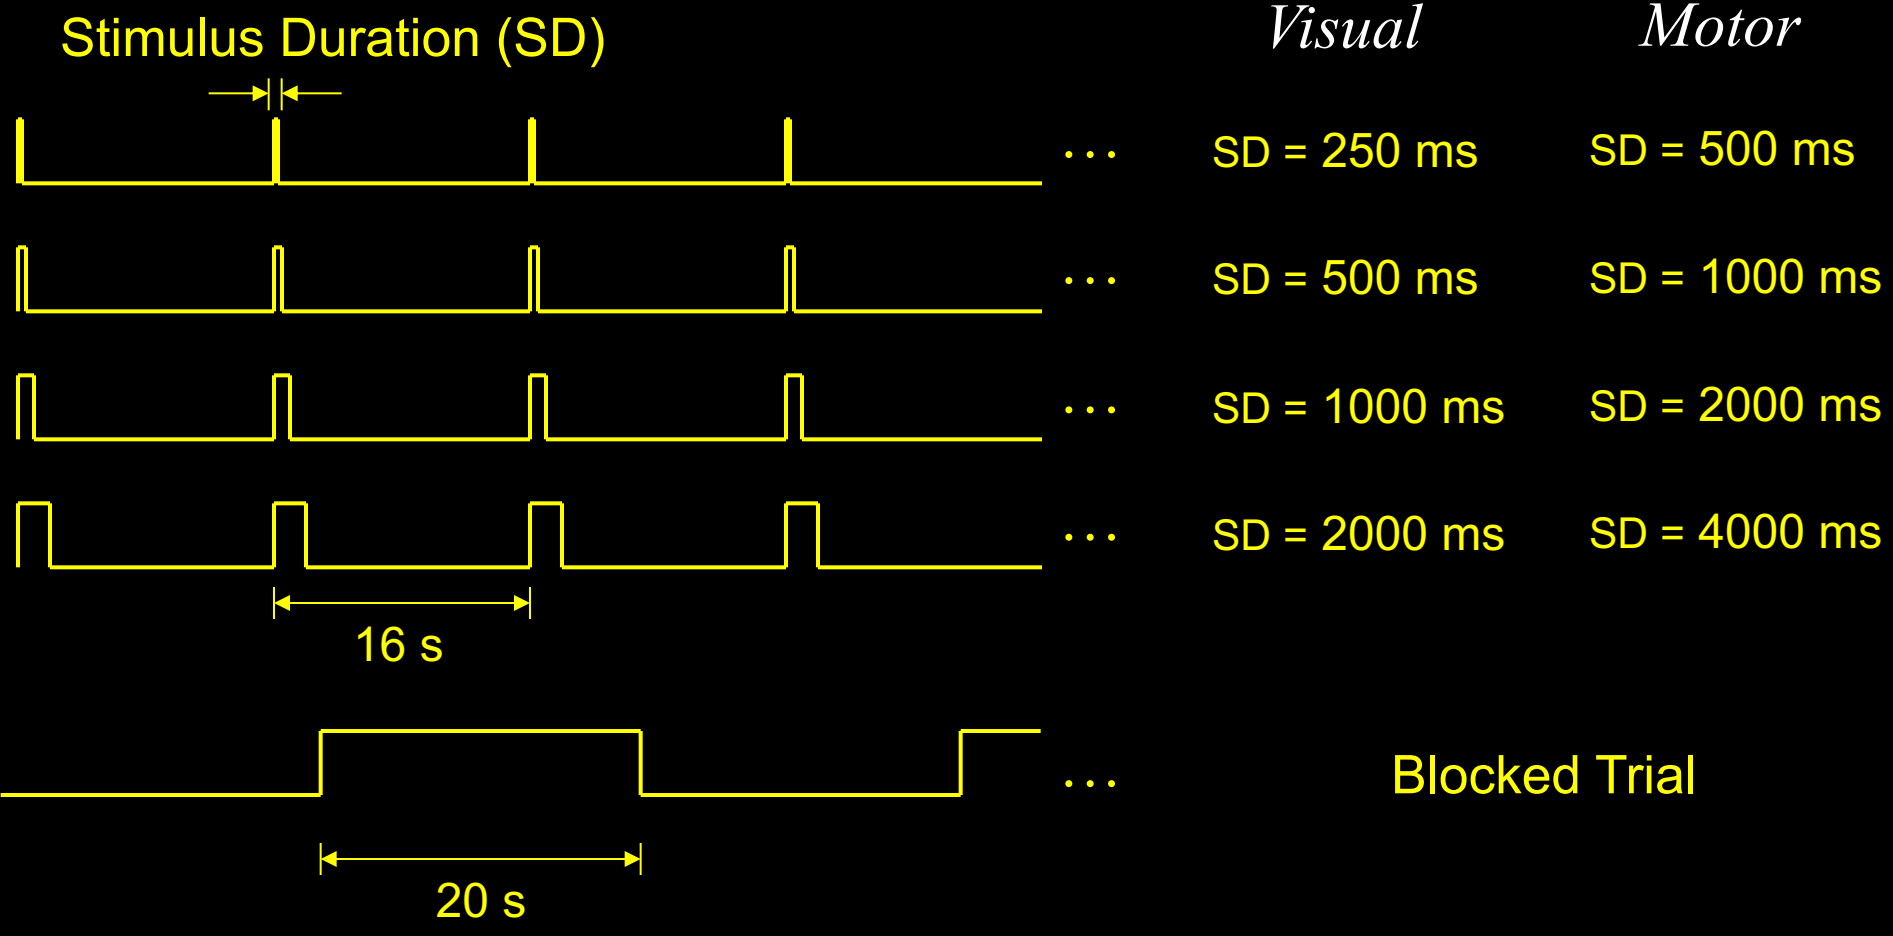

task

task

Methods

Brief stimuli produce larger responses than expected

BOLD response is nonlinear

Short duration stimuli produce larger responses than expected

Spatial Heterogeneity of BOLD Nonlinearity

R. M. Birn, Z. Saad, P. A. Bandettini, (2001) "Spatial heterogeneity of the nonlinear dynamics in the fMRI BOLD response." *NeuroImage*, 14: 817-826.

Toward Direct Mapping of Neuronal Activity: MRI Detection of Ultraweak, Transient Magnetic Field Changes

Jerzy Bodurka^{1*} and Peter A. Bandettini^{1,2}

Magn. Reson. Med 47: 1052-1058, (2002)

- Preliminary models suggest that magnetic field changes on the order of 0.1 to 1 nT are induced (at the voxel scale) in the brain.
- These changes induce about a 0.01 Hz frequency shift or 0.09 deg (@ TE = 30 ms) phase shift.
- Question: Is this detectable?

Figure 1

In Vitro Results

Newborn rat brains have been found to exhibit spontaneous and synchronous firing at specific frequencies

Active state: 10 min, Inactive state: 10 min after TTX admin.

*: activity

#: scanner pump frequency
